

Playing Russian Roulette with Pharmaceutical Drugs

Deadly Dangers May Be Lurking In Your Nearest Pill Bottle

Russian Roulette – it's a rather innocent sounding term for a high stakes game with deadly consequences. First, you take a six-shot revolver and load one bullet into an empty chamber. Next, you cock the pistol, put it up to your head, and pull the trigger hoping that all you hear is a click instead of a bang. Your bang odds are one chance out of six, but if you keep playing this insane game long enough, you will eventually find that lonesome bullet.

That's what got me thinking about a similar dead end game being played every day by millions of people taking prescription medication. Let's call this one "Pharmaceutical Roulette," only in this high-stakes game the potential killer isn't a bullet, but a pharmaceutical drug lurking in your nearest pill bottle.

Every year in America thousands of people die from pharmaceutical related side effects.

Can you imagine the different perspective our society would have on this medical nightmare if these deaths were listed as casualties of war?

That's right! Pharmaceutical drugs kill, perhaps not as fast as a bullet in many cases – but just as effectively. Stay on them long enough and you're almost assured of the deadly consequences.

Do you really think for one minute that the pharmaceutical industry cares if their gun goes off? They're making an absurd amount of money selling you sickness. The combined profits of pharmaceutical companies annually are in the hundreds of billions of dollars.

They try their best to underplay how all the different pharmacological agents may interact within the body. The best they can do is provide you a virtual laundry list of potential adverse side effects that they tuck away in small print on their packaging while letting you be the Roulette guinea pig. Just look at the Vioxx scandal as an example.

We lost over 3,000 Americans on 9/11, yet year after year we lose many more than this from pharmaceutical side effects and most people never give it a second thought.

Instead, the FDA shelters and protects this industry of death. The twisted pharmaceutical philosophy of "health" is completely contradictory to good health principles, yet forms the basis of university curriculum that is used to brainwash all future doctors into this grand scam.

Mainstream media bestows praise and accolades upon this industry for their "so-called" medical achievements while the FDA, AMA, WHO and other pharmaceutical alphabet soup front operatives do all in their power to squelch and destroy safe, natural, non-toxic, non-lethal and proven methods of treatment. **It's really no surprise that the rapid expansion of the pharmaceutical industry with the help of its lackeys is in direct correlation to the rapid decline in health we're seeing throughout the world.** There's a reason why health care costs are skyrocketing.

The pharmaceutical industry has made sure that they have hundreds of different symptoms requiring medication and they're sure you suffer from at least one of them.

There are well over 150 million Americans taking at least one pharmaceutical drug every day. Some are taking upwards of fifteen to twenty, especially the guinea pigs in nursing homes and hospitals that are pumped full of them against their will. **In this medical basket of goods they've got everything from A to Z to suppress symptoms, but nothing to help you get well and off of their drugs.** The sad fact is once you're on pharmaceutical drugs you will be for the rest of your life unless you get a wake up call on this grand deception. **All pharmaceutical drugs are designed to keep you in a perpetual state of disease management.**

They've got antacids, anti-anxiety drugs, anti-acne drugs, anti-arrhythmic drugs, anti-asthmatic drugs, antibiotics, anti-coagulants, anti-convulsants, anti-depressants, anti-diabetic agents, anti-diarrheals, anti-diuretics, anti-emetics, anti-estrogens, anti-histamines, anti-hypertensives, anti-infectives, anti-inflammatory agents, anti-psychotics, anti-spasmodics, anti-thyroid agents, anti-ulcer agents, anti-virals – anti *ad infinitum*.

If this present course of madness is not altered, soon the entire planet will be medicated with some type of pharmaceutical drug. But then again, perhaps that's the ultimate goal.

It may come as a shock to many of you that the Bible implies that pharmaceutical drugs are a tool of the devil and that they're being used to deceive the nations of the world. Let me explain.

The word sorcery as it appears in the New Testament version of the King James Bible comes from the Greek word *pharmakeia*, which is where the English words *pharmaceutical* and *pharmacy* both come from. With that fact in mind, the following scripture takes on a whole new meaning: "*For by thy sorceries (pharmaceuticals) were all nations deceived. And in her (Babylon) was found the blood of prophets, and of saints, and of all that were slain upon the earth.*" (Rev. 18:23-24) Pretty frightening interpretation – wouldn't you say?
